

Laser Skinned Infields and Infield Mixes...

A smooth playing surface and correct water drainage is critical for skinned softball and baseball infields. Laser Grading is the solution to provide both a smooth playing surface while properly draining excess water out of the infield or playing surface.

Laser Topdressing...

is the next generation of topdressing; utilizing laser measurement devices to precisely distribute topdressing on playing surfaces on athletic fields and recreational turf, such as baseball infields and outfields as well as football and soccer fields.

Aerate annually when you fertilize.

Deep Core® Aeration loosens packed soils and changes the composition of the soil in the root zone, providing an environment that encourages deep root growth.

IMPROVES turf grass response to fertilizers

BOOSTS beneficial microbial activity

PROMOTES recovery from turf grass injury or disease

PREPARES soil for overseeding and reseeding

VERTICUTTING cuts through the thatch layer. When overseeding, this allows maximum seed to soil contact causing the seed to establish more quickly. Sandman also offers an engineered starter fertilizer, pre-emergent and feeding program designed for athletic fields.

Grass Type	JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
Bermuda Zoysia	Apply Lime		Topdressing™ and Deep Core® Aerating									Apply Lime
	While dormant, apply post emergent to kill green weeds		32-3-12 Growing Season Blend with micronutrients			38-0-0 uf NitroBOOSTER with minors		Turf Growth Regulator				
		21-0-21 with Pre-emergent							8-2-34 with Pre-emergent			

Rye Over- Seeding	Apply Lime		Deep Core® Aerating							Aerating & Overseed		Apply Lime
	While dormant, apply post emergent to kill green weeds		32-3-12 Growing Season Blend							32-3-12 Growing Season Blend with micronutrients		
			38-0-0 uf NitroBOOSTER							38-0-0 uf NitroBOOSTER with minors		
		21-0-21 with Pre-emergent						8-2-34 with Pre-emergent		15-23-22 Starter		

Nitroform® serves as the nitrogen source in the Sandman Professional Fertilizer Blends.

The nitrogen in Nitroform® is a methylene urea nitrogen source. It is released to growing plants by soil bacteria. Bacteria initially convert the more soluble fraction of the product so that approximately 1/3 of the nitrogen is released in the first 4 - 6 weeks. Intermediate chain-length molecules are broken down more slowly. The remaining 70% of the nitrogen will be released through soil microbial activity.

Because the N in Nitroform® is mostly water insoluble, and is gradually released by soil microbes, it is resistant to leaching and runoff, even in sandy soils, under heavy rainfall or irrigation. Nitroform has a low salt index thus a very low burn potential.
